

GoobledyGook v0.1

Author

Developed by Steven Yau at WMS UK Uxbridge office using C# with WPF. Uses [google-language-api-for-dot-net](#) library for the Google Translator services.

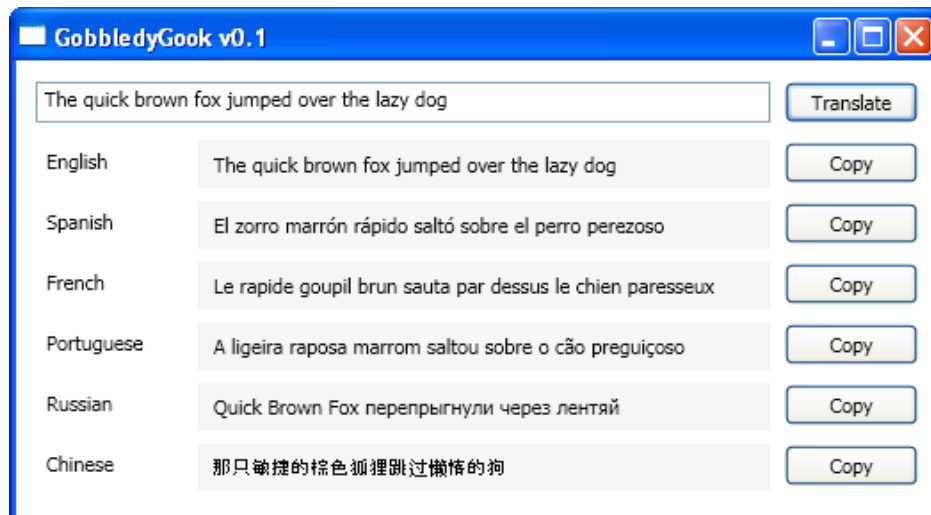

Email: syau@wms.com

Introduction

One of the problems we have late in the project is that we find translated text no longer fit the areas we have allocated in the interface well. This tool is designed to be used early on in the process to find the longest translated screen and cater for it early during the design phase.

Usage

Pretty straightforward to use.
